

# **What is Clinical Research?**

## **Video Transcript**

Clinical research brings scientists, doctors and patients together.

Our shared goal is to understand, diagnose, prevent and treat diseases.

Our clinical research program at the University of Oxford investigates conditions of the brain and mind.

Our research uses cutting edge technologies.

We invite volunteers to have brain scans at our research centre.

We can take pictures of the brain with high detail and clarity.

We also analyse data collected in hospitals.

We create software that can extract precise measurements of brain features.

These can improve our understanding of the brain and help us to develop new treatments.

By working together, we hope to improve clinical care for those suffering with conditions of the brain and mind.

Thank you for supporting our research together we can, and will, make a difference.
