

WHAT ROLE SHOULD THE PUBLIC PLAY IN ANIMAL RESEARCH?

How could members of the public shape scientific research that uses animals? We want to hear your views!

- **Public Involvement (PI)** brings patients, carers, advocates, and members of the public into the research process to help **shape** how research is **designed, conducted, and shared**.
- While widely used in clinical research, it remains **uncommon in preclinical research**, where animals are often used to learn more about biology and disease.
- This **short survey** seeks to understand the expectations and experiences of **members of the UK public** on PI in animal research.

For more information and to complete the survey, scan the QR code or click on the link below:
